

Air conditioning unit with asymmetrical high-capacity heat exchanger and integrated output-regulated heat pump and efficient volume flow control for medium-sized and large public swimming pool halls

ThermoCond 39 13 01 - simplified illustration

Automatically selects the most economical operating mode!

## ThermoCond 39

AIR VOLUME FLOW: 2,600 – 33,500 m<sup>3</sup>/h

Eurovent seal refers to range Menerga Air, more information on page 6. Check ongoing validity of certificate: [www.eurovent-certification.com](http://www.eurovent-certification.com) or [www.certiflash.com](http://www.certiflash.com)

### At a glance:

- Dehumidifies, ventilates and heats
- Corrosion-free heat exchanger made from polypropylene
- Integrated output-regulated heat pump
- Average heating capacity value COP up to 7.2
- Energy-saving EC fans/EffiVent
- Demand-oriented volume flow rate reduction for supply and return air
- Two-stage supply air filtration
- Precise measurement and regulation of the outside air volume
- Fulfils the requirements of VDI 6022

Devices of the series 39 achieve a very high energy efficiency, since the integrated program only adds as much air as is required for dehumidification of the pool hall air. The overall efficiency of the system is further enhanced by the

integrated heat pump. Due to the structural design of the unit the cleanliness according to VDI 6022 is ensured.

### Further performance parameters and options:

- Modular design with high variability
  - Filtering the air in any operating mode
  - Pumped hot water air heater
  - Individually controllable performance parameters
  - Complete unit, ready to connect, contains all structural elements for air conditioning swimming pool hall air, including all control and regulation fittings
  - Thermal bridge factor TB1
  - Intensive quality inspection with factory test run
- Options
- Pool water condenser
  - HRC bypass function
  - Dehumidification in recirculation mode
  - Dehumidifying the outside air using additional outside and exhaust air connection pieces
  - Reinforced compressor refrigeration system
  - Fresh water heater
  - Attenuator
  - Outdoor installation
  - Remote maintenance
  - And many more

## Functional Description

### Standby mode

If no requirements are specified regarding temperature regulation or dehumidification when the swimming pool hall is in standby mode, the system operates only in recirculation mode. The air circulation in the swimming pool hall is guaranteed, with the fans working at a lower capacity.

### Recirculation Air Operation (heating)

The pumped hot water heating coil heats the swimming pool hall as required in recirculation mode. In order to reduce the internal pressure losses, the recirculation

air defrost damper is also opened. The outside air and exhaust air dampers are closed.

### Swimming pool mode with dehumidification requirements

Return air is cooled and dehumidified in the evaporator of the continuously adjustable heat pump, reinforced by the upstream heat exchanger. The outside air, with its low moisture content, is preheated in the heat exchanger, and is subsequently mixed with a proportion of untreated recirculated air, heated in the condenser using the heat energy from the dehumidification process, and fed into the swimming pool hall as supply air. If the heating capacity is not sufficient, the supply air is reheated with the heating

coil. The use of the freely controllable heat pump allows the demand-oriented regulation of the volume flow rate. This guarantees a consistent humidity level in the swimming pool hall while consuming minimal energy. For hygiene reasons, a minimum of outside air is fed into the swimming pool hall during swimming pool mode. The proportion of outside air is determined based on the current evaporation of water (and therefore the occupancy level of the swimming pool hall) and is continuously adjusted.

### Outside Air Exhaust Air Mode

In the case of rising outside air humidity, the recirculation air damper is continuously closing as required. If the outside air moisture is high, the damper closes completely, the system works exclusively in outside air-exhaust air mode via the

heat exchanger. The demand-oriented flow rate control reduces energy consumption to a minimum.

### Optionally

In order to achieve the hall humidity levels required by VDI 2089 in summer-time conditions, it may be necessary and more economical to use an additional damper system. A second outside air duct is used to take in outside air. Some of the outside air is precooled via the recuperator, and then cooled below dew point in the evaporator. The air is

then reheated in the recuperator, and then dried and cooled with some of the untreated outside air, before being introduced into the hall as supply air. If no heating of the swimming pool hall is required, the heat of condensation is discharged directly into the return air flow.

# ThermoCond Type 39

## System dimensions and weights

**Important!** Where a system is operated in parallel, the supply air and return air ducts of the two units have to be brought together.

Where units are run in parallel, each unit has a controls cabinet.

Mirror-image design possible.

For service work, a clearance corresponding to dimension W is required on the operating side of the unit. If dimension W is smaller than one metre, please leave a clearance of one metre. For service work above the unit, please allow 50 mm working height clearance above the cable duct.

Please comply with the dimensions for body size, air duct connections and electrical controls cabinet.

All lengths are given in mm, weights in kg, weight incl. controls cabinet.

- 1 May change depending on chosen option
- 2 Door fitting assembly increase unit width by 65 mm each operating side
- 2 incl. 120 mm base frame, incl. 60 mm cable duct

3 transportation units are supplied, including controls cabinet. Further partitioning for smaller apertures possible (at extra cost).
